Problem 3 (due on Monday, October 10)
 $\backslash f r a c\{f(x)+f(y)\}\{2\} \backslash$ geq $f l \operatorname{left}(\backslash f r a c\{x+y\}\{2\} \backslash$ right $\left.)+\backslash \sin ^{\wedge} 2(x-y) \backslash\right]$ for all $\$ x, y \backslash$ in $\backslash m a t h b b$ R ?

b) Is there a function \$f:\mathbb R\longrightarrow \mathbb R\$ such that \[ \frac $\{f(x)+f(y)\}\{2\} \backslash$ geq $f l \operatorname{left}(\backslash f r a c\{x+y\}\{2\} \backslash$ right $)+\backslash \sin |x-y| \backslash]$ for all $\$ x, y \backslash$ in $\backslash m a t h b b$ R\$?
ᄂ
The answer to $a$ ) is positive, for example $\$ f(x)=4 x^{\wedge} 2 \$$ has the property. The answer to $b$ ) is negative. We received only one solution, from Prof. Vladislaw Kargin, who solved a) and b) under additional assumption about \$f\$ (essentially that $\$ \mathrm{f} \$$ is continuous). For a detailed solution and some related material see the following link Solution.
